

Informed consent of the patient / legal representative:

Head physician: Senior consultant MUDr. Tomáš Fořt

PLASMA ADENOIDECTOMY

(Endoscopic removal of pharyngeal tonsil with plasma coblation)

Head anaesthesiologist: MUDr. Roman Baláž	
Name and surname of the patient:	
Insurance number:	

I. Information about the nature of ailment:

Enlarged lymphatic tissue in nasopharynx may cause breathing, sleeping and speech disorders, as well as malfunction of Eustachian tube which may cause frequent inflammation of the upper respiratory tract or middle ear. This may even lead to hearing impairment.

II. Information about the medical procedure:

The surgery is performed in general anesthesia. The patient is given anesthetics by a sensitive injection or by inhalation of non-toxic inhalation anesthetics. Unlike regular scalpel adenoidectomy or laser-assisted adenoidectomy, which use a curette in the first stage of the surgery, this procedure does not use any sharp surgical tools.

After the onset of anesthetic effects the overgrown tissue in nasopharynx is under endoscopic control sensitively removed with a plasma field developed at the end of a probe which immediately stops the bleeding and the disintegrated tissue is removed by suction. The advantage of the method consists in the fact that the tissue in nasopharynx is only exposed to temperatures of 40-70° Celsius. The method accelerates healing and minimizes post-surgery pain. The hypertrophic tissue of pharyngeal tonsil is more thoroughly removed in those places that cannot be reached by a curette or laser in case of regular methods. The base of the pharyngeal tonsil is not traumatized with sharp tools – the pharynx tissue makes no pressure on the child's cervical spine.

The procedure takes ca 20 minutes. Patient's vital functions are subsequently monitored in a recovery room for ca 2-3 hours. The patient is checked before being discharged. Benefits of the surgery include improved nasal breathing, protection against frequent infections (common cold, inflammation of middle ear).

III. Risks of the procedure (general, individual):

There is a very low risk of early or late post-surgery bleeding and wound infection. Smell from the nose after this type of surgery is a normal symptom of healing, as well as temporarily increased temperature. Extraction of front teeth may also occur as a result of intubation. The risk of overall anesthesia increases with age and seriousness of other diseases of the patient and it also includes potential unpredictable reactions of the organism to administration of medicaments and other procedures associated with a surgery in general anesthesia. The result of the surgery depends on individual healing.

IV. Alternatives of the procedure:

Treatment with antibiotics and allergological and immunological treatment. The advantage of those methods is that they are not invasive. The surgery should be used after all conservative therapeutic options have been exhausted, as recommended by an ENT specialist or pediatrician. If the surgery is refused the child is at risk of poor nasal breathing, frequent inflammation of the upper respiratory tract, sleeping disorders and impairment of healthy development.

V. Answers to additional questions from the patient/legal representative: (or indicate that the patient did not ask any additional questions)
